

# Design and Construction of Two-lift Concrete Pavements for Pennsylvania

Lev Khazanovich and Julie Vandebossche

IRISE ANNUAL MEETING

MAY 17, 2023

# The Problem

- ❑ Concrete pavements in PA are
  - ❑ Overdesigned
  - ❑ Difficult to construct smooth do to excessive thickness
  - ❑ Overly expensive
  
- ❑ Two-lift paving
  - ❑ reduce cost
  - ❑ increase sustainability

# Project Objectives

- ❑ Develop design and construction recommendations for two-lift concrete pavements for Pennsylvania conditions
- ❑ Develop NDE technology for QA/QC control of PCC/PCC bond

# Project Approach

- Task A: Literature review
- Task B: Laboratory testing
- Task C: Development of the design guidelines
- Task D: Construction of experimental two-lift concrete pavement section
- Task E: Non-destructive evaluation of experimental two-lift concrete pavement section
- Task F: Draft final report
- Task G :Final report

# Literature Review

# Literature Review: US Experience with PCC/PCC

- \* The first concrete pavement constructed in the United States—in 1891 in Bellefontaine, OH—was a two-lift pavement. Several two-lift concrete pavements were built in the early 1900 in Duluth, MN
- \* Not common technique now
- \* PCC/PCC largely ignored by US researchers; limited existing US research focuses on...
  - \* Design methods (emphasis on debonding, shear at interface) that have become less relevant given MEPDG and wet-on-wet construction
  - \* Performance impact of lean concretes in lower lifts and concerns of debonding (again, wet-on-wet construction and EU experience suggests debonding not a concern)
  - \* Performance impact of base types

# EU Experience with PCC/PCC

- \* Two-layer composite PCC pavements have been constructed in EU since the 1950s
- \* Countries who have used two-layer PCC include: Austria, Belgium, France, Germany, Netherlands, and Switzerland
- \* Austria has been regularly constructing two-layer PCC since 1960s and is most experienced in the field
- \* Two-layer design is the standard for PCC in Austria and is slated to become the standard in Germany
- \* Great deal of quality EU research and construction expertise, including use of exposed aggregate concrete (EAC) textures on PCC-PCC

# US PCC/PCC Case Studies

- ❑ Florida US-41 (1978)
  - ❑ “Econcrete” lower layer and standard PCC in top layer, variation among sections in base layers
  - ❑ RIPPER study reported minimal differences in performance
- ❑ Kansas K-96 (1998)
  - ❑ 3 two-layer sections to study RAP in lower layer; use of high quality—but ASR inducing—aggregate in top layer; and effect of different material properties in PCC layers on bonding
  - ❑ Final section study (effects of differences in layers) addressed by Springenschind from Munich Tech in early 1990s
- ❑ Michigan I-75 (1993)
  - ❑ Two-layer JRCP, EAC construction near Detroit used European design and contractor (Ruboco from Belgium) for texturing
  - ❑ Problems with construction (texture and joint reinforcement)

# US PCC/PCC Case Studies

- ❑ Kansas I-70 (2008)
  
- ❑ SHRP R21 Minnesota I-94,(2010)
  - ❑ 2 two-layer sections to evaluate
    - (1) RA in lower layer a
    - (2) exposed aggregates
  
- ❑ Illinois Tollway (2021)
  - ❑ Use one paver
  - ❑ Use RAP in the lower lift

# Literature Review: SHRP R21 Project

## □ Project Team

1. PI: Dr. Mike Darter, ARA
2. Co-PI: Dr. Lev Khazanovich, University of Minnesota
3. Co-PI: Dr. Julie Vandebossche, University of Pittsburgh

## □ Three tests:

1. Visit of pavement sections in Germany and Austria
2. Development of the design guidelines
3. Construction of test sections at MnROAD

# Lower Layer Paver

Lower mix dumped ahead of first paver

IRISE

# Lower Layer Paver with DBI

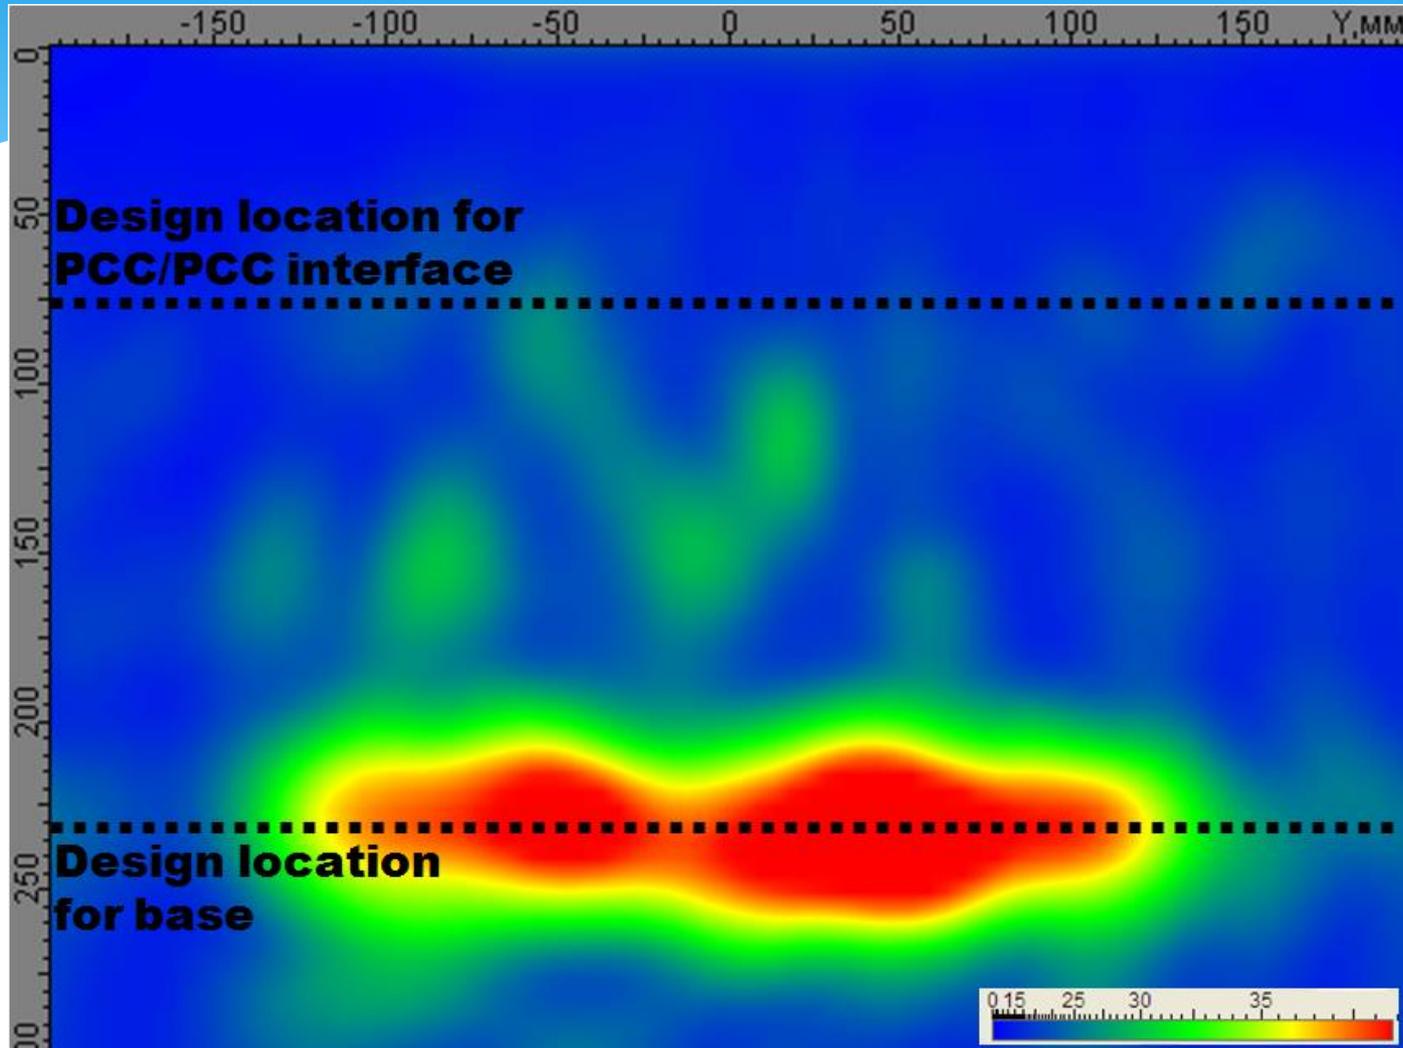

Dowels: 25 mm diameter, 50 cm length;  
Tie bars: 20 mm diameter, 80 cm length

# Upper Lift Paver

# R21. Tomogram of sound PCC-PCC interface

# Project Schedule

Months	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17	18	19	20	21	22	23	24
